# LV52206XA

**Bi-CMOS IC** 

# **Dual channel LED Boost Driver** with PWM and 1-Wire Dimming

http://onsemi.com

#### **Overview**

The LV52206XA is a high voltage boost driver for LED drive with 2 channels adjustable constant current sources.

#### **Features**

- Operating Voltage from 2.7V to 5.5V
- 1-Wire 32 level digital and PWM dimming
- Integrated 43V MOSFET
- 600kHz Switching Frequency

# **Typical Applications**

• LED Display Backlight Control

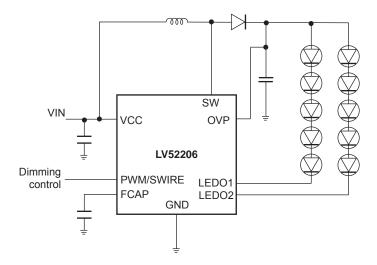

Fig1. 5×2 LED Application

#### ORDERING INFORMATION

See detailed ordering and shipping information on page 11 of this data sheet.

#### **Absolute Maximum Ratings** at Ta = 25°C

| Parameter                   | Symbol              | Conditions      | Ratings     | Unit |
|-----------------------------|---------------------|-----------------|-------------|------|
| Maximum supply voltage      | V <sub>CC</sub> max | V <sub>CC</sub> | 5.5         | V    |
| Maximum pin voltage1        | V1 max              | SW              | 43          | V    |
| Maximum pin voltage2        | V2 max              | Other pin       | 5.5         | V    |
| Allowable power dissipation | Pd max              | Ta = 25°C *1    | 1.30        | W    |
| Operating temperature       | Topr                |                 | -30 to +85  | °C   |
| Storage temperature         | Tstg                |                 | -55 to +125 | °C   |

<sup>\*1</sup> Mounted on a specified board: 70mm×70mm×1.2mm (4 layer glass epoxy)

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

#### **Recommendation Operating Condition** at Ta = 25°C

Continued on next page.

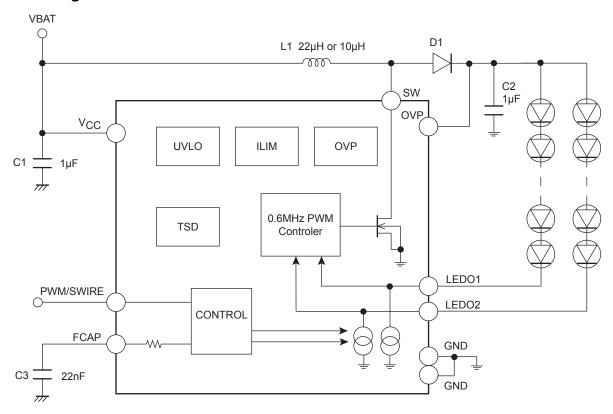

Caution 1) Absolute maximum ratings represent the values which cannot be exceeded for any length of time.

Caution 2) Even when the device is used within the range of absolute maximum ratings, as a result of continuous usage under high temperature, high current, high voltage, or drastic temperature change, the reliability of the IC may be degraded. Please contact us for the further details.

# **Dimming Mode Selection**

Dimming Mode is selected by a specific pattern of the SWIRE within Tsel (1ms) from the startup of the device every time. In order to startup the device, the SWIRE must keep high for longer than Ton.

#### **PWM Mode**

The dimming mode is set to PWM mode when it is not recognized as a digital mode within Tsel. To enter Digital Mode, the SWIRE is required keeping in low state for Tw1 (See Fig.4). If the PWM frequency is used faster than 6.6kHz, the dimming mode is set to PWM mode only. But slower than 6.6kHz, it is necessary to avoid entering the digital mode condition, such as SWIRE keeps high for longer than Tsel. PWM is enabled after Tdel from Tsel.

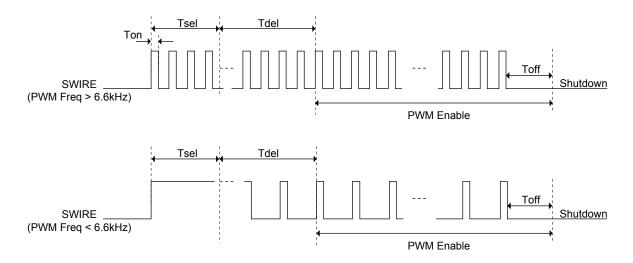

Fig3. SWIRE Timing Diagram in PWM mode

#### **Digital Mode**

To enter Digital Mode, SWIRE should be taken high for more than Tw0 ( $100\mu s$ ) from the first rising edge and keep low state for Tw1( $260\mu s$ ) before Tsel(1ms).

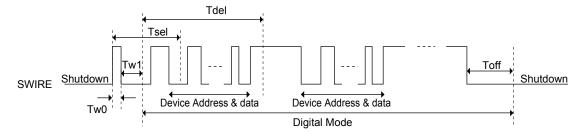

Fig4. SWIRE Timing Diagram in Digital mode

It is required sending the device address byte and the data byte to select V<sub>FB</sub>. The bit detection is determined by the ratio of Th and Tl (See Fig6). The start condition for the bit transmission required SWIRE high for at least Tstart. The end condition is required SWIRE low for at least Tend. When data is not being transferred, SWIRE is set in the "H" state. These registers are initialized with POR (Power On Reset).

In the LV52206XA, the device address(DA7 to DA0) is specified as "01110011". AKct is setting for the acknowledge response. If the device address and the data byte are transferred on AKct=1, the ACK signal is sent from the receive side to the send side. The acknowledge signal is issued when SWIRE on the send side is released and SWIRE on the receive side is set to low state.

|         | Register | BIT | Description |
|---------|----------|-----|-------------|
|         | DA7      | 7   | 0           |
|         | DA6      | 6   | 1           |
|         | DA5      | 5   | 1           |
| Device  | DA4      | 4   | 1           |
| Address | DA3      | 3   | 0           |
|         | DA2      | 2   | 0           |
|         | DA1      | 1   | 1           |
|         | DA0      | 0   | 1           |

Table1. Device Address Description

#### Start up and Shutdown

The device becomes enabled when SWIRE is initially taken high. The dimming mode is determined within Tsel and the boost converter start up after Tdel. To place the device into shutdown mode, the SWIRE must be held low for Toff.

# **PWM MODE**

#### **Digital MODE**

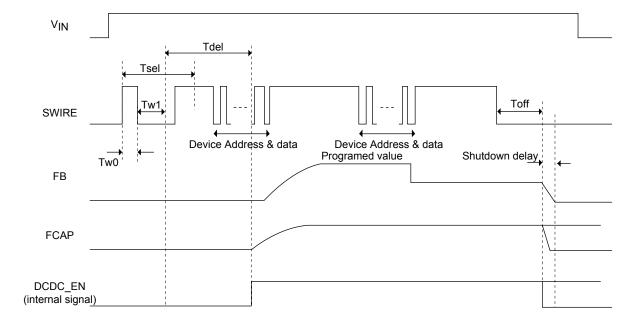

Fig7.Start up and shutdown diagram

#### **Open LED Protection**

If OVP terminal voltage exceeds a threshold Vovp (38V typ) and LEDO terminal voltage less than 0.05V for 8 cycles, boost converter enters shutdown mode. In order to restart the IC, It is necessary to start it again from a shut down condition.

#### **Over Current Protection**

Current limit value for built-in power MOS is around 1A. The power MOS is turned off for each switching cycle when peak current through it exceeds the limit value.

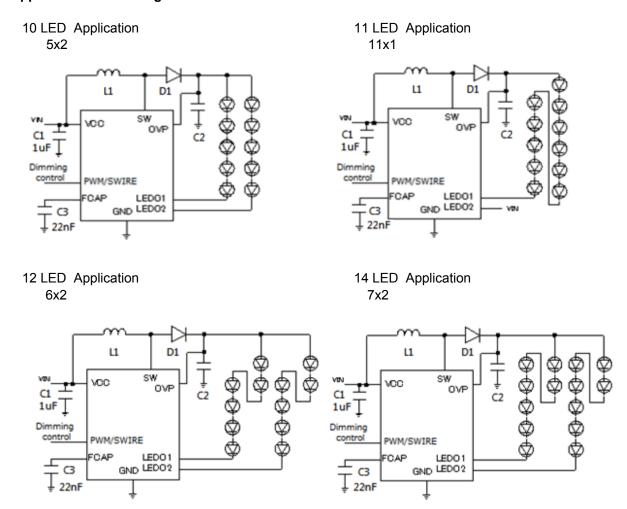

#### **Under Voltage Lock Out (UVLO)**

UVLO operation works when V<sub>IN</sub> terminal voltage is below 2.2V.

#### **Thermal Shutdown**

When chip temperature is too high, boost converter is stopped.
